

➤ Not only biodegradable, these Eco-Cleaners contain live microbes which break down wastes and feed the soil.

➤ Our range of Bio-Fertilisers boosts the microbial activity of the soil and unlocks nutrients making them readily available.

➤ Our innovative inoculation techniques are patented in Australia and overseas.

BioTech Innovators

Biotechnology: The use of microbes or biological substances to perform specific industrial or manufacturing functions.

VRM produces high quality Bio-Tech formulations for water and soil remediation. Functions include: Odour Control, Compost Accelerants, Bio-Fertilisers, Waste Treatment, Organic Recycling, Eco-Cleaners. The leading manufacturer/distributor of EM (Effective Microorganisms) products in Australia, VRM holds patents in Australia and overseas for its innovative Microbial Balancing technology.

By using VRM's innovative kitchen composter, users can easily and without odour convert all of their food scraps into a nutrient rich soil conditioner. This unique composting system uses the revolutionary Bokashi (natural odour eater) to create the ideal conditions for anaerobic composting. Bokashi ferments the food scraps, preventing them from rotting and therefore eliminating odours and the attraction of flies.

To use the Kitchen Composter, simply place all left over food scraps, in the bucket and sprinkle a handful of Bokashi every time you do so.

Every few days, drain the compost tea from the bottom of your bucket. It makes a great natural fertilizer, simply dilute it with water and feed to your plants. By using Bokashi you will ensure good bacteria proliferate and hence eliminate odours. Bokashi achieves this by promoting fermentation of the food scraps rather than putrefaction.

WHY COMPOST

- Composting can convert food and garden waste into dark coloured soil (humus) in a matter of a few weeks
- Composting food and garden waste saves valuable land fill space
- Over half of our household garbage is made up of food and garden waste. Most of this waste can be composted
